1.INTRODUCTION

1.1PROJECT OVERVIEW

The retina of the human eye can develop visible microvascular consequences from a complicated condition of diabetes including diabetic retinopathy and macular edema, the images of which are being employed for manual disease screening and diagnosis. Deep Learning based automation design for this labour workload could be more effective. Although we only employ a time portion of photos in training, higher image resolutions help our deep learning system to identify diabetic retinopathy comparatively better than previous studies. Besides, we present cutting-edge results for accurate classification of images as per medical five-grade diabetic retinopathy scales and for the first time for the four-grade diabetic macular edema scales. These results cover five different screening and clinical grading system for the classification of diabetic retinopathy and macular edema. These methodology prove that deep learning system could improve screening and diagnosis cost-effectiveness while delivering supreme performance levels, and that technology could be used in clinical exams demanding finer grading.

1.1 PURPOSE

The most prominent microvascular consequence of diabetes is diabetic retinopathy, and retinal imaging is the commonly used tool for diagnosing because of its great sensitivity. Based on the fundus or retinal images of the patient's eyes, medical professionals today determine the severity of retinopathy associated with the person having diabetes. As the number of diabetic patients rises quickly, more retinal images will be generated by screening programmes, which imposes a very heavy work pressure on medical professionals and raises the cost of healthcare services. An automation system could help with this both as a mechanism for complete diagnosis or reduce the workload of scientific professionals. The application of deep learning models for automated identification of diabetic retinopathy has been examined in two recent publications. Both demonstrate that a deep learning artificial neural network-based automated system can diagnose pertaining diabetic retinopathy, which is classified as moderate, with significant sensitivity and specificity. Other related eye disorders, such as diabetic macular edema, potential glaucoma,

and age-related macular degeneration, have also recently been studied with this method.

An automated system must be able to categorise retinal pictures using severity scales that are clinically acceptable, such scales for diabetic retinopathy and macular edema that are being suggested internationally and that are being used in Finland. Recent studies for the former example of the diabetic retinopathy scale may be found in the literature, however no studies have been conducted yet to categorise macular alterations with the later scale. The enormous number of annotated photos required for the model to learn is regarded to be a significant impediment to the deeper learning system's broader and more successful application.

The ultimate goal of this project is to classify macular edema and diabetic retinopathy using five distinct classification schemes. We provide the most recent findings for the biologically meaningful five categories of classification, as well as the initial four grade macular edema classification, in addition to the previous research of the referable diabetic retinopathy classification system. Additionally, we outline the pre-processing and regularisation processes that must be performed on the data for the deep learning system to perform properly and carefully examine how the scale and quantity of photos used in training affect the system's performance.

2. LITERATURE SURVEY

2.1 EXISTING PROBLEM

A diabetic complication that affects the retina of the eye is diabetic retinopathy. Damage to the blood vessels in the tissue at the back of the eye (retina) is what causes it. Initially, diabetic retinopathy may not show any symptoms or may only result in minor vision issues. Deep learning is a key component in ophthalmology to diagnose critical disorders like diabetic retinopathy (DR). Diabetic retinopathy is a common disease that diabetic patients are diagnosed with. The analyst is responsible for manually detecting exudates, which takes time.

01.	N. Memari, S. Abdollahi, M. M. Ganzagh and M. Moghbel	Computer-assisted diagnosis (CAD) system for Diabetic Retinopathy screening using colour fundus images using Deep learning	The proposed computerassisted diagnosis system starts with the segmentation of the blood vessels. Then, microaneurysms and exudates are segmentation from the image. Statistical and regional features are then extracted utilising first, second, and higherorder image features. A Deep Learning framework will be utilised for extracting additional statistical image descriptors as Deep Learning has superior contextual analysis capabilities compared to other machine learning techniques.

2.3 PROBLEM STATEMENT DEFINITION

Diabetic retinopathy is a degenerative disease that impacts the eyes and is a consequence of diabetes mellitus, where high blood glucose levels induce lesions on the eye retina. The images of retina are today used for manual disease screening and diagnosis. This labour-intensive task could greatly benefit from automatic detection using deep learning technique. Transfer Learning has become one of the most common techniques that has achieved better performance in many areas, especially in medical image analysis and classification. We used transfer learning techniques like Inception V3, Resnet50, Xception V3 that are more widely used as a transfer learning method in medical image analysis and they are highly effective.

Key rules of brainstorming

To run an smooth and productive session

- Stay in topic.
- Encourage wild ideas.
- Defer judgment.
- Listen to others.
- Go for volume.
- If possible, be visual.

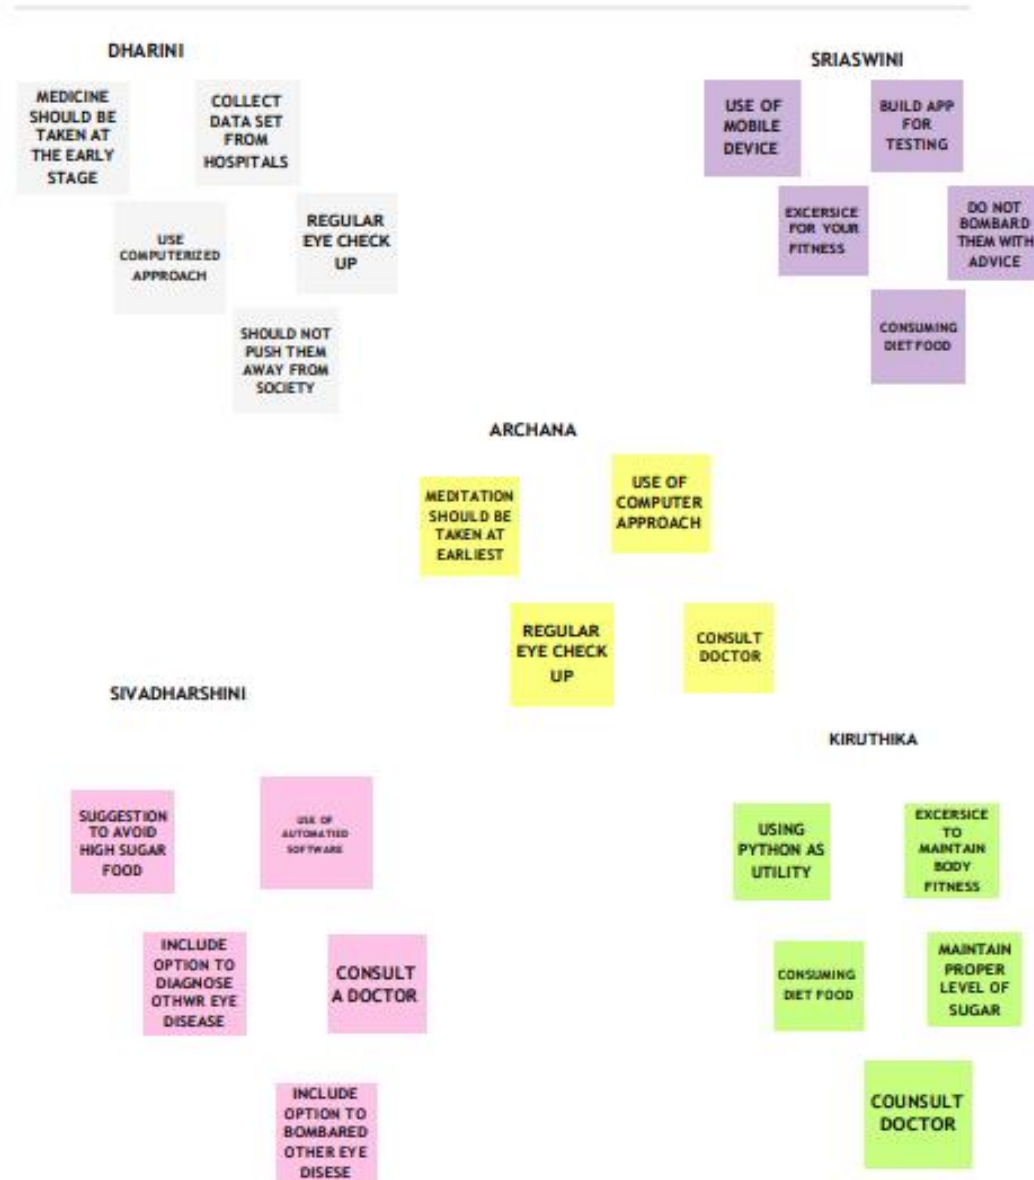

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

⌚ 10 minutes

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

3.3. PROPOSED SOULTION

S.NO.	PARAMETER	DESCRIPTION
01.	Problem Statement (Problem to be solved)	In medical field, diagnosis of diseases competently carried out by using the image processing. Therefore, that to retrieve the relevant data from the amalgamation of resulting image is too difficult. Here the segmentation technique is very useful by semisupervised learning then the result can be tuned by using Deep Learning Neural Network.
02.	Idea / Solution description	This laser treatment, also known as focal laser treatment, can stop or slow the leakage of blood and fluid in the eye. During the procedure, leaks from abnormal blood vessels are treated with laser burns.
03.	Novelty / Uniqueness	Recent advances in the understanding of the pathophysiology of DR, in particular, the key role of cytokines, such as vascular endothelial growth factor (VEGF), have led to the development of anti-VEGF antibodies for intraocular use. Anti-VEGF therapies have largely replaced laser photocoagulation for the treatment of diabetic macular edema.
04.	Social Impact / Customer Satisfaction	The success of telescreening and the management of diabetic retinopathy (DR) in communities depends on stakeholder satisfaction, including both individuals with diabetes and community health center (CHC) staff.

05.	Business Model (Revenue Model)	Nearly 30 percent of diabetics suffer from diabetic retinopathy. Diabetes-related blindness costs can total more than \$500 million per year
06.	Scalability of the Solution	Our solution consists of an imaging device and software for automatic classification of measurements that will indicate if an individual has diabetic retinopathy, even when operated by a non-expert.

4. REQUIREMENT ANALYSIS

4.1 FUNCTIONAL REQUIREMENT

Following are the functional requirements of the proposed solution:

FR NO.	FUNCTIONAL REQUIREMENT (EPIC)	SUB REQUIREMENT (STORY / SUB-TASK)
FR-1	Uploading Image	Uploading image by taking selfie or by accessing the camera album.
FR-2	Get Verification	Get verification code from mail.
FR-3	Collect Data	Collect data from various sources for training model , by accessing the data.
FR-4	Create Samples	Creating samples from the data collected and train the module according to the information from the user.
FR-5	Conclusion Report	After analysis a conclusion report is generated to the user.

4.2 NON-FUNCTIONAL REQUIREMENTS

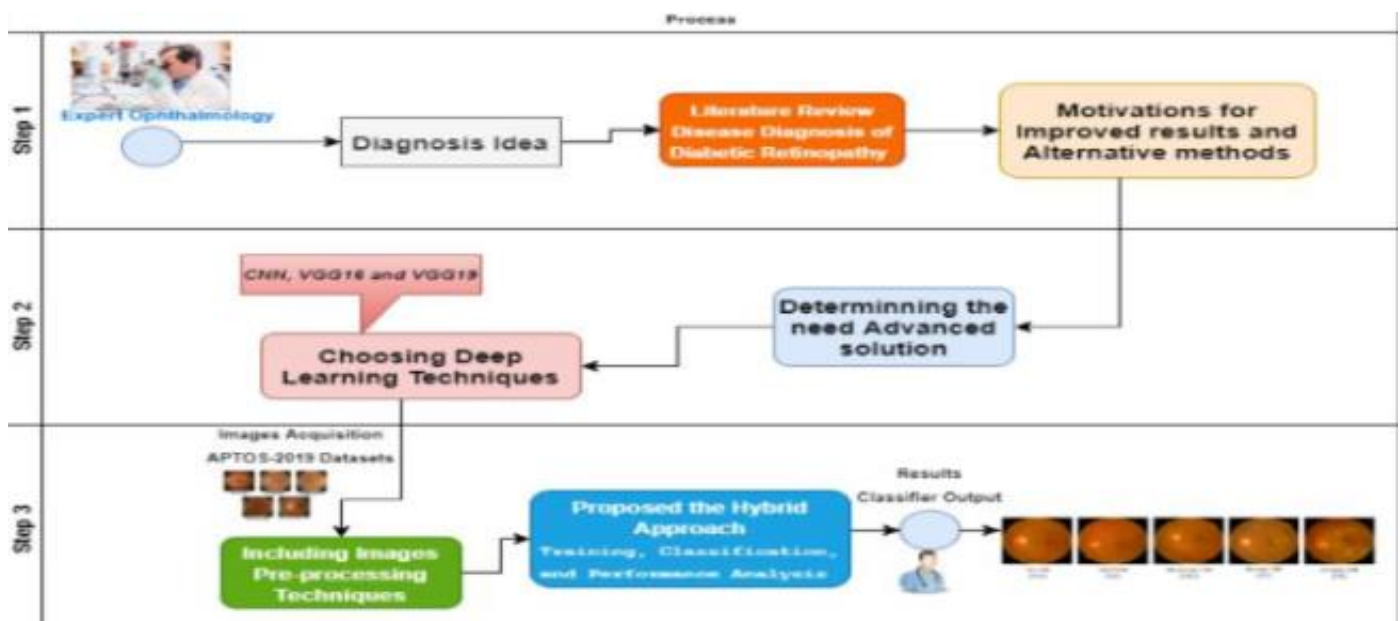

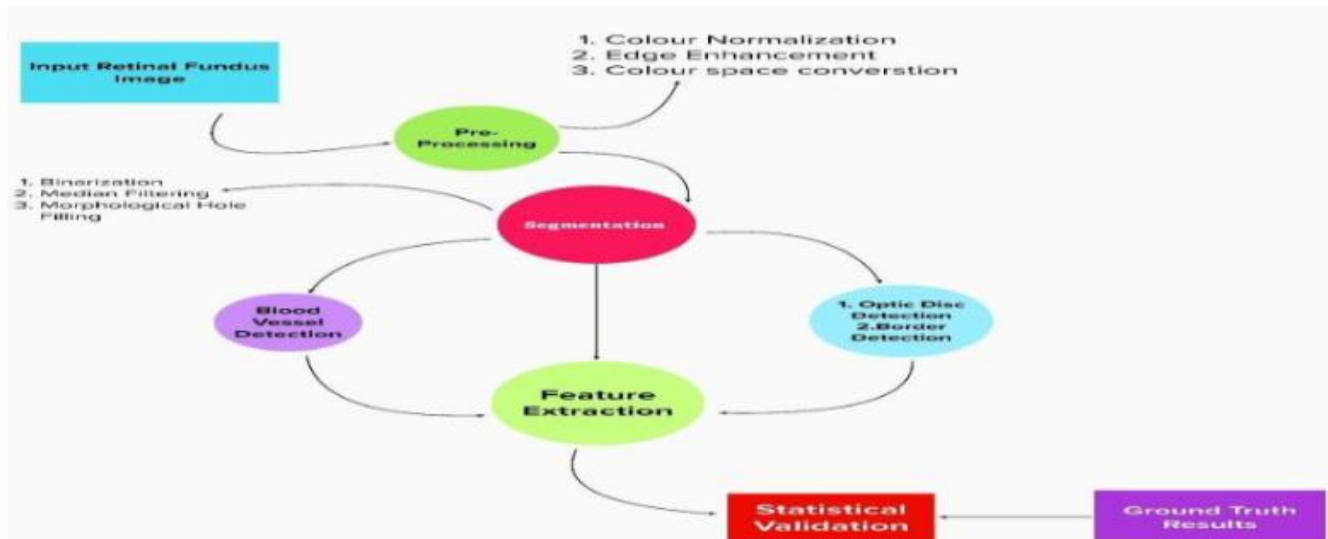

Following are the functional requirements of the proposed solution:

FR NO.	NON-FUNCTIONAL REQUIREMENT	DESCRIPTION
NFR-1	Usability	The specific product should be easily usable to each and every user all around the world.
NFR-2	Security	Security of the users plays a very important role and the specific product should satisfy it.
NFR-3	Reliability	The specific product must be totally trusted by the user.

NFR-4	Performance	The performance of the product plays a very important role.It determines the satisfaction of the user.
NFR-5	Availability	The product should be easily available in the market.
NFR-6	Scalability	The product should be small and compact in size,in that case it can be easily carried by the user.

8.1 TEST CASES

TEST ID	TEST CASE	TEST DATA	EXPECTED RESULT	ACTUAL RESULT	PASS
1.	Login	Username: Password:	Redirects to dashboard page	Redirects to dashboard page	Yes
2.	Upload	Image of retina	Received in backend by model and interference returned	Received in backend by model and interference returned	Yes
3.	Label	Dashboard after upload	Label displayed below image clearly	Label displayed below image clearly	Yes
4.	Logout	Click on logout button	User redirected to login page	User redirected to login page	Yes

8.2 USER ACCEPTANCE TESTING

USN-1:

Story: As a user, I must be able to upload image of my eyes.

Acceptance criteria: I can upload or take image to the portal.

USN-2:

Story: As a user, I will receive the diagnosis as to whether I have retinopathy or not.

Acceptance criteria: I can receive the diagnosis.

USN-3:

Story: As a user, I receive the severity of the retinopathy.

Acceptance criteria: I can receive the severity of the retinopathy.

USN-4:

Story: As a user, I can receive the suggested remedy.

Acceptance criteria: I can receive the suggested remedy.

10.ADVANTAGES & DISADVANTAGES

Methods based on Artificial Intelligence and its subdivision Deep Learning has the potential to enhance and advance healthcare. To simplify the implementation of AI in healthcare environment, several significant obstacles must be managed to overcome. A few other factors are identified as crucial steps for the approval of AI models through regulatory processes, in addition to the conventional methods that are used to evaluate the model's performance, such as accuracy measures. Although the transition from conventional to deep learning machine learning methodologies has increased the performance of these analyses, it has also been accompanied by a lack of clarity and comprehensibility. However, a key factor influencing their acceptability and incorporation in clinical practice seems to be how interpretable such models appear. The model's decision-making process must be understood by the professional user and should preferably explain how it arrived at its predictions.

11. CONCLUSION

A major consequence of diabetes mellitus, diabetic retinopathy causes gradual retinal degeneration and can even result in permanent blindness. To prevent it from getting worse and further harming the retina, it is crucial to diagnosis it early. Since numerous DL systems have evolved and been integrated into medical care, there has been an increased interest in using them to diagnose diabetic retinopathy. This will help physicians treat patients more effectively and efficiently. This report outlines the advancements in investigations on using deep learning to diagnose diabetic retinopathy.

In the proposed model, Expectation-Maximization (EM) algorithm was used to classify the categories. But the model produced a very low rate of accuracy of 75%. The flaw led to the alternative solution of using a combination of ResNet and VGG as a hybrid model to classify the highness of diabetic retinopathy. Finally, this hybrid model resulted in 99 % accuracy.

12.FUTURE SCOPE

Furthermore, incorporating more patient metadata that may enhance their chance of acquiring retinopathy, such as genetic variables, the length of their diabetes, the haemoglobin A1C number, and other clinical information could be beneficial to integrate data about explicit disease aspects in the classification models. This could advance the AI model by producing illuminating insights into the underlying Diabetic Retinopathy risk variables and possibly improve diagnostic performance.
